## V-shaped recovery?

- ▶ **Consensus earnings revisions ratios for all main regions are showing a V-shaped profile, as are some economic indicators**
- ▶ **Improvement has been so dramatic that earnings upgrades are now almost matching downgrades for the world index**
- ▶ **Normalising rates: combination of stabilising profitability and favourable valuations should allow equities to live with the normalisation of long-term interest rates, in our view**

Issue no. 138

## Disclaimer & Disclosures

This report must be read with the disclosures and the analyst certifications in the Disclosure appendix, and with the Disclaimer, which forms part of it

Very few commentators appear to be giving serious consideration to the likelihood of a 'V'-shaped global economic recovery (which may make you wonder where the balance of risk lies from here). The most popular representative letters still appear to be 'W', 'U' and 'L'. But, if the profile of analysts' earnings revisions is any guide, the possibility of a decent rebound in economic growth and corporate earnings should not be ruled out.

The normalisation of interest rates has been beginning to feature in our discussions with investors, spurred by the sell-off in government bonds. As we write, the sheer steepness of the yield curve seems to have capped the surge in long-term yields, for a while at least. And recent levels of yields are not yet hitting equity valuations materially: the implied risk premium remains well above trend. But, at some stage, equity markets will have to tackle this question more definitively.

In our view, a combination of stabilising profitability – which may be a little closer perhaps than we'd thought – and favourable (cyclically adjusted) valuations, together with a conscious decision by asset allocators eventually to dump bonds and money-market mutual funds for stocks, should allow equities to live with the normalisation of long and even short-term interest rates when this finally happens for real.

## V-shaped recovery?

Very few commentators appear to be giving serious consideration to the likelihood of a 'V'-shaped global economic recovery (which may make you wonder where the balance of risk lies from here). The most popular representative letters still appear to be: 'W' (a double-dip growth profile); 'U' (a period of depressed growth followed by a slow and lacklustre recovery); and 'L' (a stagnant/depressionary growth profile).

But, if the profile of analysts' earnings revisions is any guide, the possibility of a decent rebound in economic growth should not be ruled out. Take, for example, the right-hand chart on the front page. This shows the revisions ratio for the FTSE World index. As recently as January, the series hit a record low of just 13%, with downgrades outnumbering upgrades by a factor of 7 to 1. Around this time depression fears were rising, complete financial meltdown was still on the agenda and any concept of a recovery seemed a remote possibility to many.

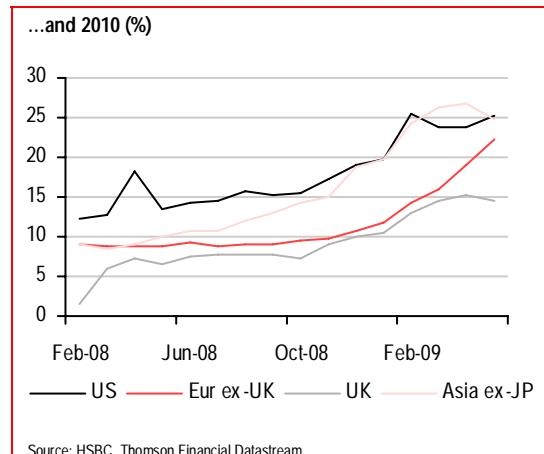

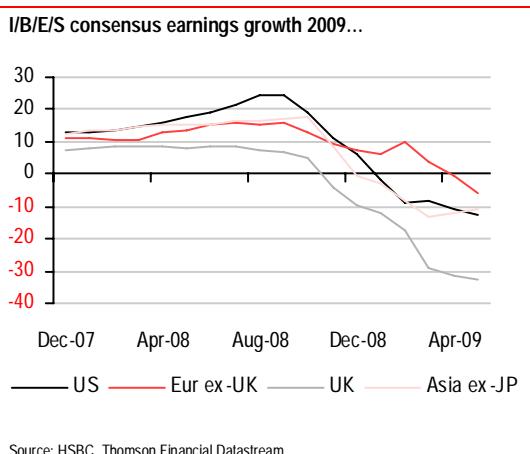

Since then, the series has taken off and the rise has been so rapid that the latest reading of 45% stands above the long-term average. That's a pretty impressive turnaround and suggests to us that the worst of the downgrade cycle is now behind us.

*Note, the source of the data is I/B/E/S consensus and we define the revisions ratio as the total number of earnings upgrades as a percentage of the total number of earnings revisions.*

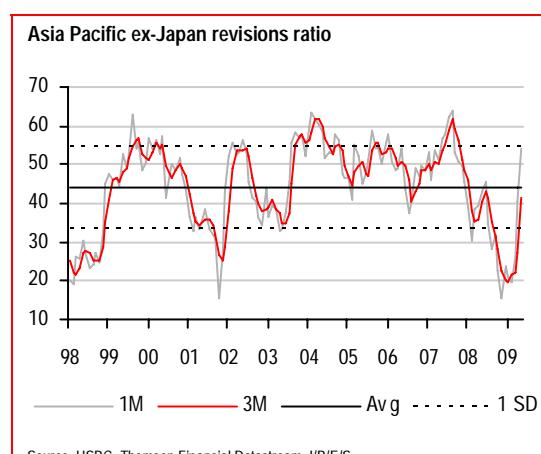

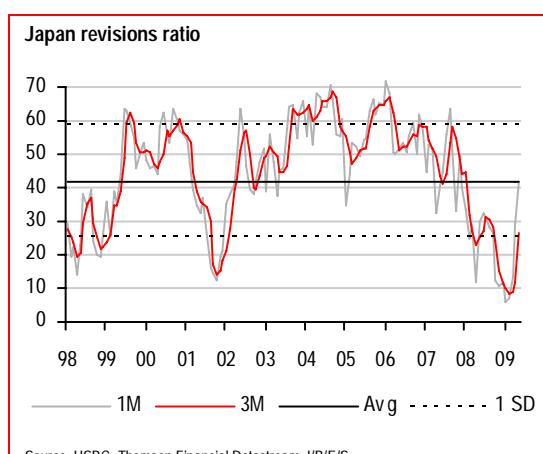

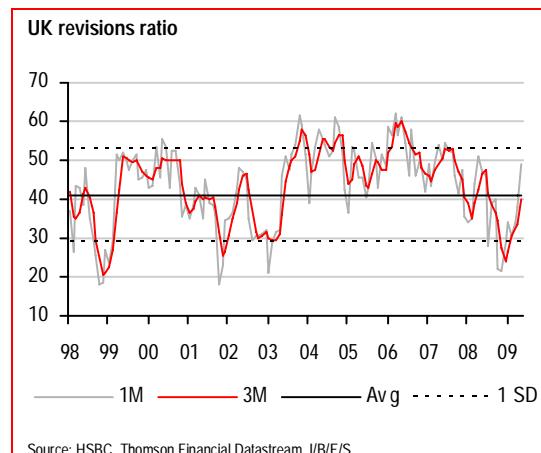

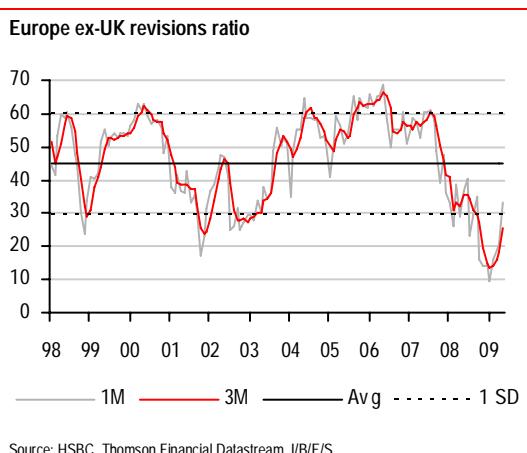

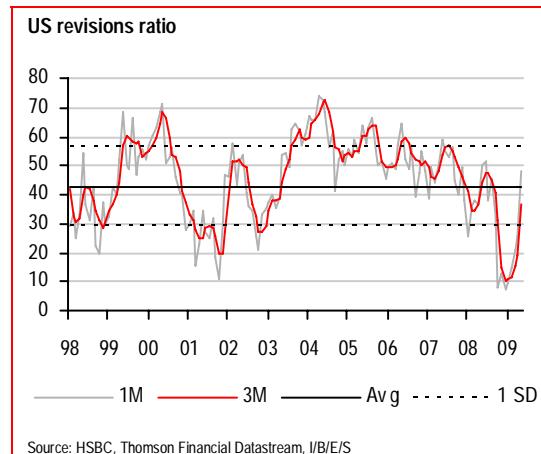

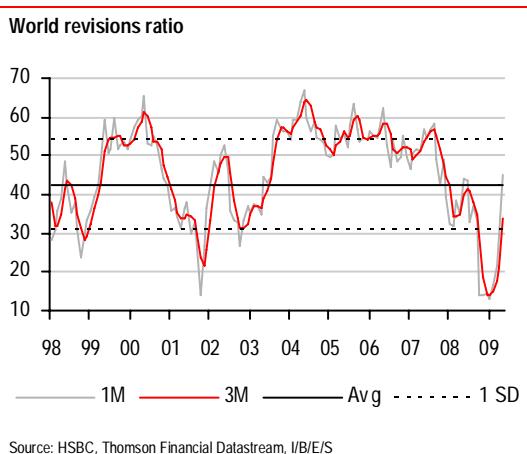

The charts on the following page confirm that the impressive rebound in the World index revisions ratio has been repeated across all of the key regions. We find that the revisions ratios in all of the regions (except Europe ex-UK) have risen at least back to their long-term average levels. Moreover, in the case of Asia Pacific ex-Japan, we are now seeing more earnings upgrades than downgrades, with a revisions ratio of 54%.

In our view, our findings add to the growing body of evidence that suggests the worst-case scenario of a 'Great depression' looks unlikely.

Admittedly, the first half of a 'W' can also look like a 'V' and therefore it would be unwise to rule out a double-dip in the profile of earnings revisions at some stage. However, it seems unlikely to us that the ratios will revisit the depths that they plunged to around the turn of the year.

## Revisions ratios: I/B/E/S consensus data (FTSE World indices) – upgrades as percentage of all revisions

## Normalising rates: dress rehearsal

The normalisation of interest rates has been beginning to feature in our discussions with investors, spurred by the sell-off in government bonds. The yield on the 10-year Treasury note last Wednesday, 27 May, had risen 170bp from its December lows, lifting some US mortgage rates on the way, pouring cold water on mortgage refinancing and threatening to curtail the ongoing decline in corporate borrowing costs. Meanwhile, LIBORs stopped falling. Bonds rallied somewhat on Thursday and Friday, and our fixed income colleagues think the market will stabilise, but investor expectations have taken a knock.

There is (as ever) a vigorous debate over what, exactly, the immediate causes of the past few weeks' rebound in "riskless" bond yields might be. Perma-bears are adamant that the economic data show few signs of recovery and suggest that the rise in yields reflects the surge in supply, which may yet be mopped up by high savings and more Fed purchases. Gold-bugs assert that fears of US hyperinflation are to blame. We'd note that markets had previously been pricing in the risk of banking collapse and Depression, and that neither of these now seem likely.

As we write, the sheer steepness of the yield curve (see bottom left chart on p9) seems to have capped the surge in long-term yields, for

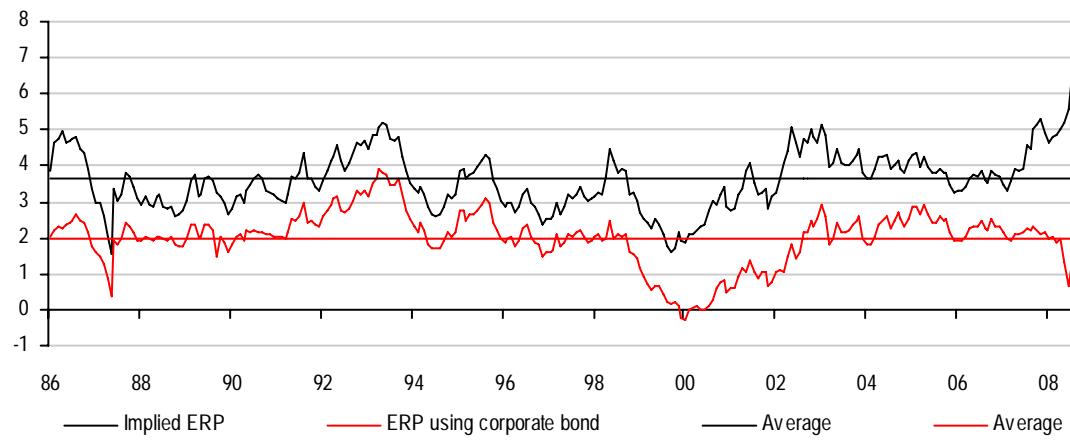

a while at least. And recent levels of yields are not yet hitting equity valuations materially: the implied risk premium remains well above trend – see chart below. But, at some stage, equity markets will have to tackle this question more definitively.

Our guess is that a combination of stabilising profitability – which may be a little closer perhaps than we'd thought, see comments above – and favourable (cyclically adjusted) valuations, together with a conscious decision by asset allocators eventually to dump bonds and money-market mutual funds for stocks, should allow equities to live with the normalisation of long and even short-term interest rates when this finally happens for real.

When will this be? Things have had a habit of happening sooner than expected in this cycle and we are trying to keep an open mind about the likely exit route from the crisis.

The trajectory of growth, when it resumes, will be important. There was a lot of interest in last week's note, *Some of us are looking at the stars* (27 May 2009), in which we suggested that, from this summer's likely low points, some measures of trend economic and profit growth may accelerate, not decelerate as is widely assumed.

Estimated forward-looking implied US equity risk premium (%) – using government and corporate bonds

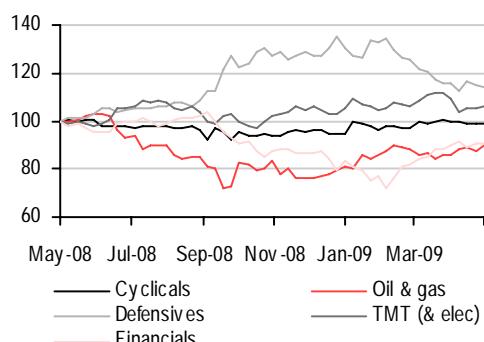

Source: HSBC, Thomson Financial Datastream

As far as the short-term profile is concerned, we don't want to get dragged into the alphabet argument – is the profile shown in the left-hand chart on the front page a scary 'W' or something more reassuring? – but we have to note here, again, that financial base effects mean that quoted sector profits at least will (eventually) bounce vigorously and possibly by more than we're currently assuming in our top-down projections for 2010.

The same may yet be the case even for short-term interest rates, but we still can't see that happening until the Fed is convinced that the economy – and profits, and by our inference stocks – can live with them. We are very carefully not labelling this notion a 'Bernanke put', because, if we've learned anything at all in the past two years, it's surely that derivative trades are not immune to counterparty risk...

## What might a global 'Nifty Fifty' look like?

The list shown here is constructed very judgementally, with little attention paid to current valuations and/or newsflow. Generally, we have opted – by definition – for large, liquid names, but in some Asian cases have had to

suspend even that consideration in favour of what we think might be an entrenched competitive advantage.

What might a global 'Nifty Fifty' look like? (Note: names in italics were members of the original US 'Nifty Fifty')

Stock	Region	Industry	Market Value (USDbn)	DY	PE	FY1	% Price change -12M	% Price change since 14/01/09

# Disclosure appendix

## Analyst certification

The following analyst(s), who is(are) primarily responsible for this report, certifies(y) that the opinion(s) on the subject security(ies) or issuer(s) and any other views or forecasts expressed herein accurately reflect their personal view(s) and that no part of their compensation was, is or will be directly or indirectly related to the specific recommendation(s) or views contained in this research report: Kevin Gardiner, Robert Parkes, Garry Evans and Steven Sun.

## Important disclosures

### Stock ratings and basis for financial analysis

HSBC believes that investors utilise various disciplines and investment horizons when making investment decisions, which depend largely on individual circumstances such as the investor's existing holdings, risk tolerance and other considerations. Given these differences, HSBC has two principal aims in its equity research: 1) to identify long-term investment opportunities based on particular themes or ideas that may affect the future earnings or cash flows of companies on a 12 month time horizon; and 2) from time to time to identify short-term investment opportunities that are derived from fundamental, quantitative, technical or event-driven techniques on a 0-3 month time horizon and which may differ from our long-term investment rating. HSBC has assigned ratings for its long-term investment opportunities as described below.

This report addresses only the long-term investment opportunities of the companies referred to in the report. As and when HSBC publishes a short-term trading idea the stocks to which these relate are identified on the website at [www.hsbcnet.com/research](http://www.hsbcnet.com/research). Details of these short-term investment opportunities can be found under the Reports section of this website.

HSBC believes an investor's decision to buy or sell a stock should depend on individual circumstances such as the investor's existing holdings and other considerations. Different securities firms use a variety of ratings terms as well as different rating systems to describe their recommendations. Investors should carefully read the definitions of the ratings used in each research report. In addition, because research reports contain more complete information concerning the analysts' views, investors should carefully read the entire research report and should not infer its contents from the rating. In any case, ratings should not be used or relied on in isolation as investment advice.

## Rating definitions for long-term investment opportunities

### Stock ratings

HSBC assigns ratings to its stocks in this sector on the following basis:

For each stock we set a required rate of return calculated from the risk free rate for that stock's domestic, or as appropriate, regional market and the relevant equity risk premium established by our strategy team. The price target for a stock represents the value the analyst expects the stock to reach over our performance horizon. The performance horizon is 12 months. For a stock to be classified as Overweight, the implied return must exceed the required return by at least 5 percentage points over the next 12 months (or 10 percentage points for a stock classified as Volatile\*). For a stock to be classified as Underweight, the stock must be expected to underperform its required return by at least 5 percentage points over the next 12 months (or 10 percentage points for a stock classified as Volatile\*). Stocks between these bands are classified as Neutral.

Our ratings are re-calibrated against these bands at the time of any 'material change' (initiation of coverage, change of volatility status or change in price target). Notwithstanding this, and although ratings are subject to ongoing management review, expected returns will be permitted to move outside the bands as a result of normal share price fluctuations without necessarily triggering a rating change.

\*A stock will be classified as volatile if its historical volatility has exceeded 40%, if the stock has been listed for less than 12 months (unless it is in an industry or sector where volatility is low) or if the analyst expects significant volatility. However, stocks which we do not consider volatile may in fact also behave in such a way. Historical volatility is defined as the past month's average of the daily 365-day moving average volatilities. In order to avoid misleadingly frequent changes in rating, however, volatility has to move 2.5 percentage points past the 40% benchmark in either direction for a stock's status to change.

Prior to this, from 7 June 2005 HSBC applied a ratings structure which ranked the stocks according to their notional target price vs current market price and then categorised (approximately) the top 40% as Overweight, the next 40% as Neutral and the last 20% as Underweight. The performance horizon is 2 years. The notional target price was defined as the mid-point of the analysts' valuation for a stock.

From 15 November 2004 to 7 June 2005, HSBC carried no ratings and concentrated on long-term thematic reports which identified themes and trends in industries, but did not make a conclusion as to the investment action that potential investors should take.

Prior to 15 November 2004, HSBC's ratings system was based upon a two-stage recommendation structure: a combination of the analysts' view on the stock relative to its sector and the sector call relative to the market, together giving a view on the stock relative to the market. The sector call was the responsibility of the strategy team, set in co-operation with the analysts. For other companies, HSBC showed a recommendation relative to the market. The performance horizon was 6-12 months. The target price was the level the stock should have traded at if the market accepted the analysts' view of the stock.

### Rating distribution for long-term investment opportunities

#### **As of 01 June 2009, the distribution of all ratings published is as follows:**

<b>Overweight (Buy)</b>	34%	(33% of these provided with Investment Banking Services)
<b>Neutral (Hold)</b>	39%	(32% of these provided with Investment Banking Services)
<b>Underweight (Sell)</b>	27%	(29% of these provided with Investment Banking Services)
